Syntax

• Resetting the index: class_size.reset_index(inplace=True) • Grouping a dataframe by column: class_size=class_size.groupby("DBN") • Aggregating a grouped Dataframe: class_size = class_size.agg(numpy.mean) • Displaying column types: data["ap_2010"].dtypes • Performing a left join: combined.merge(data["ap_2010"], on="DBN", how="left") • Displaying the shape of the dataframe (row, column): combined.shape • Performing an inner join: combined = combined.merge(data[class_size], on="DBN", how="inner") • Filling in missing values: combined.fillna(0)

Concepts

Merging data in Pandas supports four types of joins -- left , right , inner , and

- Each of the join types dictates how pandas combines the rows.
- The strategy for merging affects the number of rows we end up with.
- We can use one or multiple aggregate functions on a grouped dataframe.
