Intermediate Joins in SQL: Takeaways 🖻

by Dataquest Labs, Inc. - All rights reserved © 2020

Syntax

• Joining data from more than two tables:

```
SELECT [column_names] FROM [table_name_one]

[join_type] JOIN [table_name_two] ON [join_constraint]

[join_type] JOIN [table_name_three] ON [join_constraint]

...

[join_type] JOIN [table_name_three] ON [join_constraint]
```

• Combining columns into a single column:

```
album_id,
artist_id,
"album id is " || album_id col_1,
"artist id is " || artist_id col2,
album_id || artist_id col3
FROM album LIMIT 3;
```

• Matching a part of a string:

```
first_name,
  last_name,
  phone
FROM customer
WHERE first_name LIKE "%Jen%";
```

• Using if/then logic in SQL:

```
CASE

WHEN [comparison_1] THEN [value_1]

WHEN [comparison_2] THEN [value_2]

ELSE [value_3]

END

AS [new_column_name]
```

Concepts

- A schema diagram helps us understand the available columns and the structure of the data.
- In a schema diagram, relationships are shown using lines between tables.
- Each row's primary key must be unique.
- A recursive join is joining a table to itself.
- The SQL engine will concatenate multiple columns and columns with a string. Also, the SQL engine also handles converting different types where needed.
- We can use the pipe operator (\parallel) to concatenate columns.
- You can use the **LIKE** statement for partial matches:
 - %Jen: will match Jen at the end of a string, e.g., Sarah–Jen.
 - Jen% : will match Jen at the start of a string, e.g., Jenny.
 - **%Jen%**: will match Jen anywhere within the string, e.g., Kris Jenner.
- LIKE in SQLite is case insensitive but it may be case sensitive for other flavors of SQL.
 - You might need to use the **LOWERO** function in other flavors of SQL if is case sensitive.
